

## Leak Tightness Machine under negative pressure

- Check the leakage of the assembly line between mechanical joints and pressurized Pipes in two ways:
  - 1- Exposure to external pressure greater than internal pressure
  - 2- For vacuum measurements inside the tube and the outside pressure of the atmosphere
- Equipped with a full body steel with sealing flanges for a variety of pipe diameters
- Equipped with a water supply source for test and water storage after completion of the test
- Equipped with a test pressure supply pump with a resolution of 0.01 times and digital display
- Equipped with a vacuum pump for vacuum generation inside the pipe with a resolution of 0.01 bar
- Performing test in accordance with ISO 3459, INSO 12439, ISO 13056
